

Daleeli Database Relationships Explained

1. profiles → belongs to one syndicate

Each user is linked to one main syndicate using `syndicate_id`.

Example:

Ali selects Engineers Syndicate → `profiles.syndicate_id = engineers.id`

Why it matters:

Allows personalization and simplifies onboarding.

2. syndicates → has many requirements

Each syndicate can have multiple requirement records.

Example:

Engineers may have general, foreign degree, and renewal requirements.

Why it matters:

Keeps requirements flexible and structured.

3. syndicates → has many required documents

Each syndicate has a checklist of required documents.

Example:

ID copy, degree, passport photo.

Why it matters:

Allows clean checklist UI and validation.

4. profiles → has many registration requests

A user can submit multiple registration attempts.

Example:

Ali applies → rejected → applies again.

Why it matters:

Keeps history of applications.

5. registration_requests → has many uploaded documents

Each request can include multiple uploaded files.

Example:

ID file, degree file, photo.

Why it matters:

Supports flexible file handling.

6. news_sources → belongs to one syndicate (optional)

Sources can be syndicate-specific or general.

Example:

Ministry site = general, Engineers site = specific.

Why it matters:

Supports flexible news sourcing.

7. news_items → belongs to one source

Each news article comes from a single source.

Example:

Article comes from Ministry website.

Why it matters:

Ensures traceability of data.

8. news_items ↔ syndicates (many-to-many)

Articles can belong to multiple syndicates using a junction table.

Example:

One article applies to engineers, nurses, doctors.

Why it matters:

Avoids duplication and supports filtering.

9. profiles ↔ syndicates via news_subscriptions

Users can subscribe to multiple syndicates.

Example:

Ali subscribes to engineers and doctors.

Why it matters:

Enables personalized news feeds.

10. profiles → has many subscriptions

Users can have multiple payment records.

Example:

Ali purchases premium access.

Why it matters:

Tracks payments and access control.

11. profiles → has many contract_uploads

Users can upload multiple contracts.

Example:

Ali uploads Saudi and UAE contracts.

Why it matters:

Supports multiple analyses per user.

12. contract_uploads → has one analysis result

Each contract produces one analysis record.

Example:

Contract → one analysis summary.

Why it matters:

Ensures clean one-to-one mapping.

13. admins → create audit logs

Admin actions are recorded for traceability.

Example:

Admin approves request → logged.

Why it matters:

Ensures accountability.

14. news_sources → have many sync logs

Each source is synced multiple times, each run logged.

Example:

Synced at 8:00, 12:00, 16:00.

Why it matters:

Helps debugging and monitoring.
